Atul (Choudhary)

AI Product & Generative AI Engineer | Architecting Low-Latency
RAG Pipelines, Autonomous Multi-Agent Workflows & Scalable
Python Solutions | Vertex AI & LangChain Specialist
Greater Delhi Area

Summary

As an AI Operations Advanced Specialist at Invisible Technologies, I collaborate with global teams in delivering production-grade Generative AI solutions, showcasing adaptability in cross-time-zone engineering efforts. My work includes optimizing large language model (LLM) deployment and employing advanced agentic workflows to enhance productivity and performance. Currently pursuing a Diploma in Software Engineering at the Indian Institute of Computer Science, my technical foundation is complemented by practical experience in AI product engineering and development. My recent work includes developing Jarvis, a multimodal autonomous AI agent, optimized for near-zero latency and complex multi-agent orchestration. Certified in Vertex AI and recognized for cognitive aptitude, I am passionate about advancing the field of Agentic Automation and creating scalable, real-world AI solutions. As an AI Operations Advanced Specialist and AI Product Engineer, I am deeply passionate about pushing the boundaries of generative intelligence, multi-agent orchestration, and production-grade RAG workflows. My core focus lies in moving beyond basic model interactions to architecting scalable, low-latency autonomous systems that solve real-world operational challenges. By leveraging cutting-edge technologies like Python, LangChain, Vertex AI, and high-performance inference frameworks such as the Groq SDK, I specialize in refining large language models, engineering advanced prompt structures (Few-shot and Chain-of-Thought), and building seamless cross-platform applications. Whether it is developing custom autonomous agents like Jarvis or optimizing enterprise-grade AI pipelines globally, I thrive at the fast-paced intersection of technical innovation, agile execution, and scalable system design. As an AI Product Engineer, I am driven by the challenge of transforming complex large language models into highly optimized, production-ready autonomous systems. My core expertise lies in architecting low-latency retrieval-augmented generation (RAG) pipelines,

advanced prompt engineering frameworks (Few-shot and Chain-of-Thought), and multi-agent orchestration layers that solve real-world problems. Working across cutting-edge technologies like Python, LangChain, Vertex AI, and high-performance inference tools such as the Groq SDK, I thrive on bridging the gap between cutting-edge AI research and scalable, high-impact enterprise execution. Multi-agent systems, low-latency RAG pipelines, and scalable generative AI workflows that bridge advanced LLM research with real-world execution.

Experience

Jarvis AI (Independent Project)

AI Product Engineer

February 2026 - Present (7 months)

Remote / Greater Delhi Area

Developed and architected Jarvis, a multimodal autonomous AI agent.

Optimized for near-zero latency using Groq SDK and high-performance RAG pipelines.

Integrated Multi-agent orchestration to handle complex, multi-step reasoning tasks.

Migrated the UI to Flet for a seamless cross-platform experience.

Focusing on Agentic Workflows and real-world tool integration.

Venura Tech

AI & Machine Learning Internship

May 2026 - June 2026 (2 months)

New Delhi

Operating as an Advanced Specialist in AI training and system operations, focusing on refinement and optimization of large language models using PyTorch and applying regression techniques to improve model performance.

Developing and evaluating complex agentic workflows, multi-agent orchestration, and advanced RAG pipelines.

Engineering high-quality prompt datasets (Few-shot, Chain-of-Thought) to improve model accuracy, reasoning, and reduce latency.

Collaborating asynchronously with global teams to deploy scalable, production-grade generative AI solutions with REST APIs using FastAPI for enterprise clients.

Implemented semantic search capabilities using embeddings to enhance retrieval performance in RAG pipelines.

Utilized pandas and numpy for data preprocessing and feature engineering to support model training and evaluation.

Education

Indian Institute of Computer Science

Diploma , Software engineering · (November 2022 - November 2025)

Indian Institute Of Computer Science

Diploma , Digital marketing · (March 2025 - July 2025)

School of Open Learning (DU SOL), University of Delhi

Bachelor of Arts, BA · (November 2022 - November 2025)
